

# Count Smart

We didn't make the first contactless parts counter.

We were not the first to use x-rays to image the whole reel and use software to count components.

We were not the only ones who figured out how important counting components is for your inventory control.

And how important inventory control is to your business.

What we did do is to spend a lot of time designing a contactless parts counter you don't have to bolt to the floor.

A machine that can be easily moved around your facility (it has casters!).

A parts counter that runs on batteries so you can use when the lights go out.

A TruView™ Parts Counter that counts parts accurately.

After all, this machine was designed by the same perfection obsessed scientists who designed the other TruView products to be the best x-ray machines in their class.

They're so obsessed that all manufacturing happens right here in California so they can keep an eye on every detail of every product we ship.
